

Portability

We have ensured portability by [testing our package](#) on Debian, Fedora, macOS and Windows using R CMD check. The R team runs these checks periodically so that CRAN packages remain portable through updates to operating systems.

In addition to R CMD check, we have developed our own series of [unit tests](#) specific to our package to achieve greater than [99% code coverage](#). To maintain portability during package development, our unit tests and R CMD check are [automatically run on Windows, macOS, and three versions of Ubuntu](#) after each commit to our project repo.
